```
This sequence comprises human endometrial specific steroid binding factor II (ESF II), a protein that inhibits phospholipase A2 activity, binds to polychlorinated bipheryl compounds, reduces foreign protein antigenicity, inhibits monocyte and neutrophil chemotaxis and phagocytosis, inhibits platelet aggregation, regulates eicosanoid levels in the human uterus and controls the growth of endometrial cells. The amino acid sequence was deduced from a cDNA clone (see AAT9431) and ESF III (see AAW35802) and ESF III (see AAW35804) are also claimed. Human ESF II has about 49% identity with rat prostatic steroid-binding protein. Recombinant ESF I, II and III can be expressed in host cells for use in claimed methods (a) for treating a patient in need of ESF I, II or III (including expression of the polypeptide in vivo) and (b) for identifying compounds which bind to and inhibit activation of the ESF polypeptide. hESF I, II and III may be used to treat inflammation, asthma, rhinitis, cystic fibrosis, airway disease,
                                                                                                                                                                                                                                                                    Endometrial specific steroid-binding factor II; ESF II; human; Clara cell secretory protein; endometrium; phospholipase A2 inhibitor; polychlorinated biphenyl; antiaggregant; inflammation; asthma; rhinitis; cystic fibrosis; airway disease; neoplasia; atopy; therapy; diagnosis.

```
This represents a BU101 polypeptide sequence. BU101 is a member of the uteroglobin family of proteins and is over-expressed in breast cancer. Cells transformed with a recombinant expression system comprising a caquence derived from the BU101 open reading frame and with at least 50 percent identity to the sequences shown in AAV26458 to AAV26461 are used to percent identity to the sequences shown in AAV26458 to AAV26461 are used to percent BU101 percentific antibodies which are used correspondingly to detect BU101 percentific antibodies which are used correspondingly to detect BU101 antigens. The BU101 polymucleotide sequences can be used in method for detecting the presence of a target BU101 polymucleotide. The various assays are used for diagnosis, prognosis, stading, monitoring, treating and preventing diseases of the breast (especially cancer and its metastases), and also for determining engapibility. The BU101 polypeptides are also useful in drug screening, e.g. to identify and therapeutically to neutralise BU101 polypeptides. Fragments of the BU101 nucleic acid are useful as probes and primers, e.g. for detection of altered gene expression or in fluorescent in situ hybridisation, also in gene therapy to generate antisense or ribozyme molecules or for genetic immunisation. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Friedman PN, Gordon J;

This is the amino acid sequence of the human steroid-binding protein C1 (hSBP1) used in the method of the invention for the diagnosis, monitoring and treatment of breast cancer. HSBP1 and hSBP2 are useful as markers for breast cancer, i.e. measuring levels of hSBP2 and hSBP2 used for diagnosis or monitoring the disease, to identify subjects at risk and to discriminate between different forms of cancer for selection of appropriate therapies. They may also be used for drug screening. Nucleic acids encoding hSBP1 and hSBP2 can be used for drug screening. Nucleic acids encoding hSBP1 and hSBP2 can be used in gene therapy vectors to overexpress the steroid-binding proteins, preventing binding of steroids, for antisense sequences, ribozymes. Their nucleic acids can also be used for the diagnosis and monitoring (by quantifying expression of hSBP), as source of probes for hybridisation and amplification of genemic or related sequences for studying regulation of gene function and for mapping the genomic sequence. Antibodies are used as diagnostic reagents in standard immunoassays for hSBP

mammary cancer, endometriosis or endometrial fibroids. The method antagonist. Also described in the present invention are: (1) a method for diagnosing the above mentioned diseases comprising analysing the above mentioned diseases comprising analysing the above mentioned diseases comprising analysing the fluids, and (2) a diagnostic method for the diseases described above comprising analysing the abnormally high or low transcription level of Bisbit in cells, tissues and bodily fluids. The methods can be used to diagnose, treat, and monitor the progression, remission or recurrence of abnormal cell growth, such as cancers, especially endometrial and mammary cancer, and endometriosis and endometrial fibroids. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 MKLSVCLLLVTLALCCYQANAEFCPALVSELLDFFFISEPLFKLSLAKFDAPPEAVAAKL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Endometrial specific steroid-binding factor; human; hESF; inflammation; asthma; rhinitis; cystic fibrosis; air way disease; neoplasia; atopy; eicosanoid level regulator; chemotaxis inhibitor; endometrial cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a human endometrial specific steroid-binding protein (BSBP) II. The ESBPII protein is overexpressed in breast tumours. The specification describes a method for diagnosing prostate or a gynaecological cancer. The method comprises measuring levels of in cells, tissues or body fluids of a patient, and comparing this to levels from a normal control, where a variance in levels indicates cancer. The method is used to diagnose, stage, monitor, image or treat prostate or gynaecological cancer. The gynaecological cancer include breast, endometrial, ovarian and uterine cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 MKLSVCLLLVTLALCCYQANAEFCPALVSELLDFFFISEPLFKLSLAKFDAPPEAVAAKL 60

thus invention relates to include acts and included in the invention are hESF 1, II, and III polypeptide sequences. The nuclectide sequence exhibit antiasthmatic, antiinfalmamatory, attiallergic, and cytostatic properties. The polymucleotides are used in candyor prevent inflammation, asthma, rhinitis, cystic fibrosis, air way diesase, neoplasia and atopy. The polymucleotides are also used to inhibit phospholipase A2 activity, bind polychlorinated biphenyls, reduce and protein antigancity, inhibit monocyte and neutrophil chemotaxis and phagocytosis, inhibit platelet aggragation, regulate eicosanoid levels in the human uterus and control the growth of endometrial cells. The polymucleotides are also useful for detecting complementary complymucleotides are also useful for detecting complementary polymucleotides are alagnostic reagent. The hESF I, II and III collymucleotides are used to detect complementary polymucleotides are used to detect complementary polymucleotides are used to detect complementary polymucleotides such as associated with a dysfunction will provide a disagnostic tool that can candidatine diagnosts of a disease or susceptibility to a disease which the human under-expression, over-expression or altered expression of cendometrial cancer. They are also useful for chromosome identification.

The present sequence represents a hESF II protein sequence identified in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                          This invention relates to nucleic acid molecules encoding portions of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
Novel gene encoding human endometrial specific steroid-binding factor I, II and III which is useful for treating asthma, rhinitis, cystic fibrosis, airway disease and neoplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MKLSVCLLLVTLALCCYQANAEFCPALVSELLDFFFISEPLFKLSLAKFDAPPEAVAAKU

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                   BUIO1 is a member of the uteroglobin protein family. The present sequence is the protein sequence for human BIIO1. The present invention relates to an ultimeric polypeptide antigen, which comprises of the present sequence and mammaglobin polypeptide AAB13786. Mammaglobin is another uteroglobin protein. The presence of multimeric polypeptide antigen in a test sample can be used as the basis for a test to diagnose breast disease e.g. breast cancer, in a patient. The detection can be carried out using antibodies specific for the multimeric polypeptide antigen. The present sequence can either have a Pro or Leu residue at position 53, since the coding sequence has a single nucleotide T/C polymorphism at
Human, breast cancer; breast disease detection; mammaglobin; uteroglobin; BU101; endometrial; cytostatic.

The BU101 gene is transcribed from breast tissue. The specification describes a method for detecting the presence of a target BU101 polynucleotide in a test sample. The method comprises contacting the sample with at least one BU101-specific polynucleotide (AAA58875-80), and detecting bound polynucleotides. The method and BU101 polynucleotides are useful for detecting the presence of BU101 polynucleotides are useful for the diagnosis of breast disease, indicated by the formation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genetic subtraction; DNA microarray analysis; polymerase chain reaction; cancer; B726P; Lipophilin B; mammaglobin.
                                                                                                                                                                                                                                                                                                                                                                                                 Detecting presence of target BU101 polynucleotide in sample useful for detection of breast cancer, comprises contacting sample with BU101-specific polynucleotide and determining binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 MKLSVCLLLVTLALCCYQANAEFCPALVSELLDFFFISEPLFKLSLAKFDAPPEAVAAKL

```
The invention relates to identifying tissue-specific polynuclectides (P) that involves performing agenetic subtraction to identify pool of (P) from tissue of interest (TI), performing DNA microarray analysis to identify first subset of polynuclectides (SPI) at least 2-fold over expressed in TI, and performing quantitative polymerase chain reaction (PCR) analysis on SPI to identify second subset of (P). The method is useful for determining the presence or absence of a cancer cell in a patient, monitoring the progression of cancer in a patient using a patient, monitoring the progression of cancer in a patient using a patient, unine or a tumour biopsy sample. The methods are useful for determining the presence of a cancer in a patient using a patient, unine or a tumour biopsy sample. The methods are useful for determining the presence or absence of or monitoring progression of prostate, breast, colon, ovarian, lung, head and neck, lymphoma, leukemia, melanoma, liver, gastric, kidney, bladder, pancreatic or endometrial cancer. The present sequence represents the lipophilin B polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; endometrial specific steroid binding factor; hESF; hESFI; hESFII; hESFII; hESFIII; inflammation; asthma; thinitis; cyetic fibrosis; airway disease; neoplasia; acopy, phospholipas AS; polychlorinated biphenyl; chemotaxis; phagocytosis; platelet aggregation; eicosanoid; endometrial cell.

The specification describes hESFI, hESFII, and hESFIII. hESFII, II and III polypeptides, and polynucleotides encoding them are useful for treating and preventing inflammation, asthma, rhinitis, cystic fibrosis, airway disease, neoplasia and atopy, inhibiting phospholipase A2 activity, binding polychlorinated biphenyls, reducing foreign protein antigenicity, inhibiting monocyte and neutrophichemotaxis and phagocytosis, inhibiting platelet aggregation, regulating checken in the human uterus, and for controlling the growth of endometrial cells. hESF polypeptides and nucleotides are also useful for research, biological, clinical or therapeutic purposes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 MKLSVCLLLVTLALCCYQANAEFCPALVSELLDFFFISEPLFKLSLAKFDAPPEAVAAKL 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                               The invention relates to a complex comprising a lipophilin-like polypeptide linked by at least one disulphide bond to a second lipophilin-like protein are members of uteroglobin superfamily. Lipophilin-like protein are members of uteroglobin superfamily. Lipophilin-like proteins are useful in the preparation of vaccines. The complex containing lipophilin-like proteins are useful for treating or preventing breast, ovarian or prostate cancer. The complex is also used for determining the presence or absence of cancer in a patient, or monitor the progress of cancer in a patient. Lipophilin DNA is also useful in gene therapy. The present sequence is human lipophilin B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; ovarian cancer; marker; cancer; familial history; brain disorder; central nervous system disorder; bacterial meningitis; viral meningitis; Alzheimer's disease; Parkinson's disease; cerebral oedema; hydrocephalus; brain herniation; inflammation; encephalitis; testicular disorder; nontuberculous granulomatous orchitis; connective tissue disorder; heart disorder; ischaemic heart disease; atherosclerosis; neoplasm; histological type; carcinogenic; ovarian cancer marker.

```
The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosting or characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing ovarian cancer (e.g. patients having a familial history of ovarian cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis, Alzheimer's disease or parkinson's disease), brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disorders (e.g. cerebral codema, hydrocephalus or brain herniations), inflammations (e.g. bacterial or viral meningitis or encephalitis), testicular disorders (e.g. bacterial or viral meningitis or encephalitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disease or atherosclerosis). The compositions and methods may also be used in assessing the histological type of neoplasm associated with ovarian cancer, monitoring the progression of ovarian cancer, determining whether ovarian cancer has metestasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the ovarian cancer post of compound, or inhibiting ovarian each cancer or at risk of developing ovarian cancer. The present amino acid sequence represents one of the ovarian cancer markers described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
Assessing whether a patient is afflicted with ovarian cancer, useful in assessing the stage or progression of the disease, comprises comparing the expression level of a cancer marker in a sample from a patient and from a non cancer patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MKLSVCLLLVTLALCCYQANAEFCPALVSELLDFFFISEPLFKLSLAKFDAPPEAVAAKL

The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a biological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown in the specification. The method of the invention is useful in the diagnosis or prognosis of breast cancer, and for detecting genes that are up or down-regulated in breast cancer cells. Genes identified by the method of the invention can be used in diagnostic purposes and also as targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are over or under expressed in breast cancer can additionally provide high-resolution, high-sensitivity datasets which can be used in the areas of diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. Amino acid sequences ABJ05535 - ABJ05604 represent the proteins encoded by the 69 breast cancer-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Androgen-independent cancer; androgen ablation therapy; prostate cancer; androgen-dependent prostate cancer; prostate cancer.
                                                                                               Detecting a breast cancer-associated transcript in a patient's cell, useful for diagnosing breast cancer, comprises contacting a biological sample with a polynucleotide that selectively hybridizes with breast cancer nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MKLSVCLLLVTLALCCYQANAEFCPALVSELLDFFFISBPLFKLSLAKFDAPPEAVAAKL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                 The present sequence represents a endometrial specific steroid-binding factor (hESF) II. The full length protein has a molecular weight of 9.9 kDa. The protein has hamology to rat prostatic steroid-binding protein C2. Antibodies which bind hESF proteins, such as hESF I, HESF II, and hESF III are useful for isolating or to identify clones expressing the polypeptides or to purify the polypeptides by affinity chromatography. Agonists and antagonists of hESF proteins are useful for treating and/or preventing susceptibility to asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Breast cancer; breast cancer-associated gene sequence; drug development; pharmacogenetics; biosensor development.
                                                                                                                                                                                                                         New antibody specific for human endometrial specific steroid-binding factor (HESF) III, useful for detecting HESF III protein in biological sample and to isolate or identify clones expressing the protein.

inophilin-like polypeptide inked by a peptide bond to a second lipophilin-like polypeptide, or a fusion protein (FP2) comprising a first lipophilin-like polypeptide linked by a peptide bond to a breast tumour antigen. Also described: (1) a need by a peptide bond to a breast tumour antigen. Also described: (1) a protein (1) encoding FP1 or FP2; capecifically binds to FP2, and does not detectably bind to mammaglobin, lipophilin A. Bor C. or B305D; and (3) an isolated antibody (10) or its antigen-binding fragment that specifically binds to a mammaglobin, lipophilin A. Bor C. or B305D; and (3) an isolated antibody (11) or its antigen-binding fragment that specifically binds to a lipophilin complex. FP1 and FP2 have cytoctatic activities and can be used for determining the presence or absence of breast, ovarian or prostate cancer in a patient. FP1, FP2, (1) and (11) can be used as vaccines for inhibiting the development of cancer such as breast, ovarian or prostate cancer in a patient or a patient considered at risk for such a disease may be treated prophylactically. The fusion protein is useful for removing tumour cells from a biological sample, and for stimulating and or expending T cells specific for a lipophilin complex. (11) to the fusion protein is useful and or expanding T cells specific for a lipophilin complex. (11)
                                     The present invention describes a fusion protein (FP1) comprising a first
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           proteins are useful as markers for progression of cancer. (II) or (III) are also useful for monitoring the progression of cancer in a patient. The present sequence represents a human lipophilin B protein which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; lipophilin; mammaglobin; breast tumour antigen; fusion protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                    or absence
                                                                                     Detecting an androgen-independent prostate cancer cell in a sample or diagnosing androgen-dependent prostate cancer, by determining the presence or absence of genes whose expressions are up- or down-regulated.
                                                                                                                                                                                         The invention comprises a method for detecting an androgen-independent cancer cell in a sample from a patient who has undergone androgen ablation therapy. The method involves determining the presence or absence of nucleic acids that are either up-regulated or down-regulated in prostate cancer. The method is useful for detecting an androgen-independent prostate cancer cell in a sample from a patient who has undergone androgen ablation therapy. The method is particularly useful for diagnosing androgen-dependent prostate cancer undergoing androgen whichawal, or androgen-independent prostate cancer. The present amino acid sequence represents a protein which is encoded by a gene that is either up-regulated or down-regulated in prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a fusion protein (FP1) comprising a first lipophilin-like polypeptide linked by a peptide bond to a second to lipophilin-like polypeptide, or a fusion protein (FP2) comprising a first lipophilin-like polypeptide linked by a peptide bond to a breast tumour antigen. Also described: (1) a polyuncleotide (T) encoding FP1 or FP2; candigen. Also described: (1) a polyuncleotide (T) encoding FP1 or FP2; (2) an isolated antibody (II) or its antigen-binding fragment that specifically binds to remamaglobin, lipophilin A, B or C, or B105D; and (3) an isolated antibody (III) or its antigen-binding fragment that specifically binds to a lipophilin complex. FP1 and FP2 have cytostatic activities and can be used in vaccines and in antibody therapy. (II) specific for FP1 or (III) can be used for determining the presence or absence of breast, ovarian or prostate cancer in a patient or a patient of and (II) can be used as vaccines for inhibiting the development of cancer such as breast, ovarian or prostate cancer in a patient or a patient considered at risk for such a disease may be treated prophylactically. The fusion protein is useful for removing tumour calls from a biological sample, and for stimulating and/or expanding T cells specific for a lipophilin complex. The fusion cancer in a patient.

The proteins are useful for monitoring the progression of cancer. (II) or (III) or man a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 MKLSVCLLLYTLALCCYQANAEFCPALVSELLDFFFISEPLFKLSLAKFDAPPEAVAAKL 60

The invention discloses isolated polypeptides, which comprise human endometrial specific steroid-binding factors I. II and III (hESF I.) II and III (hESF I.) II and III (hESF I.) II and III (hESF I.) II and III (hESF I.) II and III (hESF I.) II and III (hESF I.) II and III (hESF I.) II secretive the modules of the modulate of the modulate of the modulate of the prostatic steroid-binding protein which are factors which modulate or mediate the action of hormones involved in the regulation of functions of the lung and uterus. The nucleic acids and polypeptides can be used to identify compounds that bind to and inhibit activation, raise antibodies or develop antagonists against the isolated hESF polypeptide. The polypeptide is administered by providing to the patient the DNA encoding the hESF polypeptide is administered by providing to the patient the DNA encoding the hESF polypeptides or a particular, the disease is asthma. The hESF polypeptides or a susceptibility to the disease. The sequence presented is the hESF II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                  ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                     The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACC50076 to ACC50314 and ABR47386 to ABR47632) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level of expression of the marker in the patient sample and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                Breast cancer diagnosis or treatment by comparing the level of expression of a marker in a patient sample with that in the control non-breast cancer sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9

The method is used detect breast cancer by contacting a test sample from the patient with at mammaglobin, BUI01 or a multimeric antigen, and correlating the presence of the polypeptides with breast cancer. This sequence represents the BUI01 polypeptide of the invention.
                                                                                                                                                                                                                                                                                                Assay for detecting breast cancer, comprises detecting mammaglobin, BU102 and/or BS106 breast cancer markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8

Sequence 90 AA;

```
The invention relates to a novel purified multimeric polypeptide antigen (MPA) comprising at least one BUI01 polypeptide and at least one Mamagalobin polypeptide, both of which are members of the uteroglobin family. The MPA of the invention demonstrates cytostatic activity and may act as an immune response inducer. The multimeric polypeptide complex may be useful as a marker enabling diagnosis and subsequent treatment of breast tissue disease, particularly breast cancer, but also including atypical hyperplasia, fibroadenoma and cystic breast disease. The current sequence is that of the human BUI01 protein of the invention
                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                              Novel purified multimeric polypeptide antigen comprising at least one BU101 polypeptide and at least one Mammaglobin polypeptide, useful for diagnosing breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Clark H, Jackman J, Schoenfeld J, Williams PM, Wood WI;

The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.

Claim 9; SEQ ID NO 659; 3069pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcome in the method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                      soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to detecting the presence of a nucleotide sequence, appearing as ADR46886 (an assembled cDNA contig for cancer marker gene BUI01), in breast tissue sample, involving contacting a test sample with a nucleic acid probe having a sequence complementary to ADR46886, for hybridisation to occur between the probe and ADR46886, and detecting presence of hybrids, where presence of hybrids indicates presence of nucleotide sequence ADR46886. The method is useful for detecting presence or absence of the nucleotide sequences comprising ADR46886, in a test breast tissue sample and for detecting the diseases associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting presence of BU101 (derived from breast tissue) nucleotide sequence in breast tissue sample, by contacting sample with nucleic acid probe having sequence complementary to BU101, and detecting presence of

cequences ABA08225-ABA09534 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides, and methods of identifying compounds which by polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence polypeptides of the invention properties, including cytokine, cell proliferation or cell differentiation activities, including cytokine, cell proliferation or cell differentiation activities, including cytokine, cell proliferation or cell confidence or chemotactic activity; tissue growth activities; hemomedulatory activity; activin- or inhibin-related activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; achieve activities; or may be throughly on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical
                                                                                                                                                                                                                                                                                                                      Human, cytokine; cell proliferation; cell differentiation; growth factor; haematopoiesis regulation; tissue growth; immunomodulator; activin; inhibin; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; tumour; haematopoietic disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and

conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., mathma or arthritis), proliferative retinopathy, atherosclerosis, coronary heart disease, arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal cascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incisions and ulcers), while those with commondulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders.

Commitmed inserved for example, such polypeptides may be used to culture to give rise to neurospithelial cells that can be used to augment or replace cells damaged by illness, cultommune disease or accidental damage. The polypeptides and nucleotides may also be used in the disquosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human construction

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of a mammary-specific secretory protein designated mammaglobin, which is overexpressed in 27% of stage I primary breast cancer tumours. The anonymous sequence tag previously designated DEST002 was used to demonstrate that mammaglobin is abundant in the breast cancer tumour cell line MDA-MB-415. To isolate the full-length mammaglobin cDNA (AAT50925), the mRNA was reverse transcribed from this cell line and cloned using the RACE PCR technique. The nucleic acid and protein can be used to develop prods. e.g. antibodies or probes, for the detection and treatment of breast neoplastic disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MKLIMVIAMLAALSQHCYAGSGCPLLENVISKTINPQVSKTEYKELLQEFIDDNATTNAID 60

This is the amino acid sequence of the human steroid-binding protein C2 (hSBP2) used in the method of the invention for the diagnosis, monitoring and treatment of breast cancer. HSBP1 and hSBP2 are useful as markers for breast cancer, i.e. measuring levels of hSBP1 and hSBP2 used for diagnosis or monitoring the disease, to identify subjects at risk and to discriminate between different forms of cancer for selection of appropriate therapies. They may also be used for drug screening. Nucleic acids encoding hSBP1 and hSBP2 can be used for drug screening. Nucleic acids encoding hSBP1 and nSBP2 can be used in gene therapy vectors to ever express the steroid-binding proteins, preventing binding of steroids, or antisense sequences, ribozymes. Their nucleic acids can also be used for the diagnosis and monitoring (by quantifying expression of hSBP), as source of probes for hybridisation and amplification of genomic mapping the genomic sequence. Antibodies are used as diagnostic reagents in standard immunoassays for hSBP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human steroid binding proteins Cl and C2 - useful for, e.g. diagnosis, monitoring and treating breast cancer, and for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

```
The present sequence represents a human mammary-specific protein, designated mammaglobin. The specification describes a protein comprising a mammaglobin antigen that is recognized by B and/or Tc cells specific for the natural, secreted and glycosylated form of mammaglobin specified. This protein, or recombinant vectors that express it, are used in vaccines for treating mammaglobin—expressing cancers, specifically of the breat. Such cancers can also be treated using autologous tumor lymphocytes activated ex vivo with an mammaglobin anigen, then returned to the patient. Expression of mammaglobin is elevated in 27% of stage I primary breast cancers, so it represents a marker useful for diagnosis of this disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mammaglobin, secreted protein overexpressed in breast cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents mammaglobin which is used in an example of the present invention. The present invention describes an antibody (A) which specifically binds to at least in mammaglobin epitope (ME) which is derived from an amino acid sequence having at least 50% identity to an assay kit for determining the presence of mammaglobin antipan (AM) in a test sample, comprising a containing an antibody as in (A); (2) a method for producing antibodies which specifically bind to a MA, comprising administering an isolated immunogenic polypeptide or fragment to elicit an immune response, where the immunogenic polypeptide or fragment to elicit an immune response, where the immunogenic polypeptide comprises and fragments, and (3) a method for producing antibodies which specifically bind to a MA comprising administering to a mammal a plasmid comprising a sequence which encodes at least 1 ME derived from a plasmid comprising a sequence which encodes at least 1 ME derived from a plasmid comprising an amino acid sequence (see AAW46432) and fragments.

The products and methods can be used for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining monitoring, preventing or conditions of the breast such as breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Mammaglobin is a member of the uteroglobin protein family. The mammaglobin gene has been localised to chromosome 11q13. The present sequence is the protein sequence for human mammaglobin. The present invention relates to a multimeric polypeptide antiqen, which comprises of the present sequence and BU101 polypeptide (AAB13787). BU101 is another uteroglobin protein. The presence of multimeric polypeptide antigen in a test sample can be used as the basis for a test to diagnose breast disease e.g. breast cancer, in a patient. The detection can be carried out using antibodies specific for the multimeric polypeptide antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 MKLLMVLMLAALSQHCYAGSGCPLLENVISKTINPQVSKTEYKELLQEFIDDNATTNAID 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polypeptide comprising at least seven consecutive amino acid residues of human mammaglobin, useful in the treatment and detection of breast
                                                                                                                                                                           Multimeric polypeptide antigen and antibody specific to the antigen are useful for diagnosing, detecting and treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MKLLMVLMLAALSQHCYAGSGCPLLENVISKTINPQVSKTEYKELLQEFIDDNATTNAID

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents the human mammary-specific secreted protein mammaglobin. Mammaglobin expression is restricted to the mammary gland. Dysregulation of the mammaglobin gene occurs early and frequently in breast cancer. The specification describes a method for detecting the presence of breast cancer in a patient, comprising detecting an elevated concentration of mRNA encoding a mammaglobin polypeptide. The methods are useful for detecting the presence of breast and endometrial cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; breast cancer; breast disease detection; mammaglobin; uteroglobin; chromosome 11q13; BU101; endometrial; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MKLLMVIMLAALSQHCYAGSGCPLLENVISKTINPQVSKTEYKELLQEFIDDNATTNAID 60

                                                                                                                                                                                                                                                                ઠ
                                             The present invention describes human mammaglobin peptides (I) comprising at least 7 consecutive residues. Also described are: (1) a vaccine comprising (I) with an immunostimulant which is an adjuvant; (2) an isolated antibody (Abl) or its antigen-binding fragment, which specifically binds to a mammaglobin epitope having the sequence of Pro2-3; (3) an isolated antibody (Ab2) or its antigen-binding fragment that specifically binds to glycosylated mammaglobin; (4) a method for inhibiting the development of breast cancer in a patient, comprising administering (I) or Ablo or Ab2; and (5) a method (M1) for determining the presence or absence of breast cancer in a patient. (I) has cytostatic activity. The polypeptides and antibodies are used in vaccines for the prevention and treatment of breast cancer. They are also used for diagnosis and monitoring of breast cancer. They are also used for represents the human mammaglobin amino acid sequence, which is used in an expresent invention

superfamily. Lipophilin-like proteins are useful in the preparation of vectines. The complex containing lipophilin-like proteins are useful for treating or preventing breast, ovarian or prostate cancer. The complex is also used for determining the presence or absence of cancer in a patient, or monitor the progress of cancer in a patient. Lipophilin DNA is also useful in gene therapy. The present sequence is human mammaglobin which is a lipophilin-like protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               consecutive amino call residues of human mammaglobin, where one or more mammaglobin-specific T cells specifically reacts with (I). Also included are (I) a composition comprising (I), in combination with a physiologically acceptable carrier or immunostimulant; (2) a diagnostic kit, comprising (I) and a detection reagent comprising a reporter group; (3) removing tumour cells from a biological sample, by contacting a biological sample with T cells that specifically react with (I), under conditions and for a time sufficient to permit the removal of cells expressing mammaglobin or a peptide epitope from the sample; (4) an isolated T cell population (II), comprising T cells prepared using (I);

and (5) a composition (C2) comprising a polynucleotide comprising a sequence encoding human mammaglobin (or variant or tagged with an affinity tag), or a polypeptide comprising a human mammaglobin (or variant or tagged with an affinity tag), in combination with an immunostimulant. The peptide is useful for inhibiting the development of breast cancer in a patient, by incubating CD4<sup>+</sup> and/or CD8<sup>+</sup> T cells isolated from a patient with a mammoglobin epitope, such that T cells proliferate, administering the proliferated T cells to the patient, optionally cloning at least one proliferated T cells and administering at least one cloned cell, and thus inhibiting the development of breast cancer in the patient. The compositions and methods are useful for inhibiting the development of breast cancer in a patient. The present sequence is human mammaglobin
                                                                                                                                                                                                                                                                                                                                                                 1 MKLLMVLMLAALSQHCYAGSGCPLLENVISKTINPQVSKTEYKELLQEFIDDNATTNAID 60

               detecting the presence of breast cancer in a patient, and in pharmaceutical compositions for treating breast cancer. The sequences are useful for stimulating an immune response in a patient and can therefore be used in production of vaccines. The sequences are also useful for detecting the presence of a cancer in a patient, by obtaining a loilogical sample from the patient, contacting the biological sample with a composition of the invention and detecting the amount of polynucleotide that hybridizes to the sample. This sequence represents a human breast tumour polypeptide of the invention
 polypeptide it encodes. The polynucleotide and polypeptide are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises a method of stimulating and/or expanding T cells specific for a tumour protein. The invention further comprises human nucleic acids and proteins that are associated with tumours (e.g. breast cancer). The method and sequences of the invention are useful for stimulating and/or expanding T cells specific for a tumour protein, patient and treating breast cancer. The present amino acid sequence represents a human tumour-related protein

The present invention describes a fusion protein (FP1) comprising a first lipophilin-like polypeptide linked by a peptide bond to a second lipophilin-like polypeptide. Or a fusion protein (FP2) comprising a first lipophilin-like polypeptide linked by a peptide bond to a breast tumour antigen. Also described: (1) a polynucleotide (I) encoding FP1 or FP2; comprision isolated antibody (II) or its antigen-binding fragment that specifically binds to a specifically binds to FP2 or B305D; and (3) an isolated antibody (II) or its antigen-binding fragment that specifically binds to a lipophilin complex. FP1 and FP2 have cytostatic activities and can be used for determining the presence or absence of breast, ovarian or prostate cancer in a patient. FP1, FP2, (I) and (II) can be used as vaccines for inhibiting the development of cancer such as breast, ovarian or prostate cancer in a patient or a patient considered at risk for such a disease may be treated prophylactically. The fusion protein is useful for removing tumour cells specific for a lipophilin consort.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            proteins are useful as markers for progression of cancer. (II) or (III) are also useful for monitoring the progression of cancer in a patient. The present sequence represents a human mammaglobin protein which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9

The present invention describes a fusion protein (FPI) comprising a first lipophilin-like polypeptide linked by a peptide bond to a second fighphilin-like polypeptide, or a fusion protein (FP2) comprising a first lipophilin-like polypeptide linked by a peptide bond to a breast tumour antigen. Also described: (1) a polymucleotide (1) encoding FPI or FP2; can isolated antibody (11) or its antigen-binding fragment that specifically binds to FP1 or FP2, and does not detectably bind to mammaglobin, lipophilin A, B or C, or B305D; and (3) an isolated antibody (11) or its antigen-binding fragment that specifically binds to a lipophilin complex. FP1 and FP2 have cytostatic activities and can be used for determining the presence or absence of breast, ovarian or can be used for determining the presence or absence of breast, ovarian or prostate cancer in a patient. FP1, FP2, (1) and (11) can be used as vaccines for inhibiting the development of cancer such as breast, ovarian or prostate cancer in a patient or a patient considered at risk for such or prostate cancer in a patient or a patient considered at risk for such or prostate cancer in a patient or a patient considered at risk for such cor proving tumour cells from a biological sample, and for stimulating canded or content or a patient considered at risk for such content or a patient considered at risk for such content or a patient considered at risk for such content or a patient considered at risk for such a disease may be treated prophylactically. The fusion protein is useful content or a patient considered at risk for such a content or a patient considered at risk for such a disease may be treated prophylactically. The fusion protein is useful content or a patient considered at risk for such a disease may be treated prophylactically. The fusion protein is useful content or a patient considered at risk for such a disease may be treated prophylactically. The fusion protein is useful content or a patient or a lipophila content or a lipophila content or a lipophila con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                proteins are useful as markers for progression of cancer. (II) or (III) are also useful for monitoring the progression of cancer in a patient. The present sequence represents a human mammaglobin protein sequence, which is given in an example from the present invention

The invention relates to a novel method for determining if a nucleic acid is a marker for a predetermined phenotype/cell type of interest from a blological species. The method comprises performing a global comparison of a group of expressed sequence tags (BTSP) known to be expressed in the phenotype/cell type of interest with all BSTs expressed in normal tissue in order to identify ESTs that are preferentially expressed in the phenotype/cell of interest. A method of the invention is useful for determining whether a nucleic acid is a marker for a predetermined phenotype or cell type of interest from a biological species, preferably Arabidopsis or human. The cell type of interest is an abnormal cell such as a tumour cell, and the predetermined phenotype is a stress induced phenotype such as hyperosmotic stress or high salt conditions. A method of the invention is also useful for detecting a tumour cell, and for regulating or preventing the growth of a tumour cell, and for regulating or to preventing the growth of a tumour cell, and for regulating or the sociated markers. A polypeptide of the invention is useful as an immunogen for vaccinating an animal. The present sequence represents a cumour associated antigen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 MKLIAVLALAZGHCYAGSGCPLLENVISKTINPQVSKTEYKELLQFIDDNATTNAID 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACCS0076 to ACCS0334 and ABR47386 to ABR47632) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene the rapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to a novel purified multimeric polypeptide antigen (MPA) comprising at least one BU101 polypeptide and at least one Mammaglobin polypeptide, both of which are members of the uteroglobin family. The MPA of the invention demonstrates cytostatic activity and may act as an immune response inducer. The multimeric polypeptide complex may breast tissue disease, particularly breast cancer, but also including atypical hyperplasia, fibroadenoma and cystic breast disease. The current sequence is that of the human Mammaglobin protein of the invention which is encoded by the DNA located on chromosome 11q13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MKLLMVIALAALSQHCYAGSGCPLLENVISKTINPQVSKTEYKELLQEFIDDNATTNAID 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel purified multimeric polypeptide antigen comprising at least one BU101 polypeptide and at least one Mammaglobin polypeptide, useful for diagnosing breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                      Human; chromosome 11q13; multimeric polypeptide antigen; MPA; BU101; Mammaglobin; uteroglobin; cytostatic; immune response inducer; cancer; atypical hyperplasia; fibroadenoma; cystic breast disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 93;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides polypeptide epitopes of human mammaglobin (mgb) useful for the therapy, diagnosis and monitoring of breast cancer. The invention is related to specific epitopes of mammaglobin, to antibodies and immune cells that recognise such epitopes and to methods for detecting mammaglobin in patient serum. These peptides, antibodies and cells may be useful in vaccines and pharmaceutical compositions for prevention and treatment of breast cancer. The invention is also useful to detect and /or monitor the progression of breast cancer. The present sequence is human mammaglobin (mgb) protein
                                                                                                                                                Cytostatic; epitope; mammaglobin; mgb; therapy; breast cancer; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptide epitopes of human mammaglobin useful in inhibiting development of breast cancer and in breast cancer diagnosis and monitoring, and to produce antibodies also useful in breast cancer therapy, diagnosis and monitoring.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 93;

```
The invention relates to an isolated breast cancer-associated polypeptide. The polypeptide may be used for the diagnosis and treatment of breast cancers. The methods are useful for detecting the presence of a cancer in a patient. The present sequence represents the amino acid sequence of a human breast cancer-associated polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        An isolated oncogenic polypeptide useful for preventing, diagnosing and

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Tumour-associated antigenic target; TAT; human; overexpression; cancer; tumour; diagnosis; cell proliferative disorder; breast cancer; colorectal cancer; lung cancer; ovarian cancer; liver cancer; central nervous system cancer; bladder cancer; pancreatic cancer; cervical cancer; melanoma; leukaemia; hybridisation probe; chromosome identification; chromosome mapping; gene mapping;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel polynucleotide and polypeptides for. treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.

antibodies, antagonists minimation projections are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, ovarian cancer, cancers of the central nervous system, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT polypeptide of the invention
                                                                                                                                                                                                                                                                   The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide polypeptides; expression vectors and host calls comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; fusion proteins comprising a TAT polypeptide; fusion socials comprising a tax polypeptide; fusion socials comprising a diagnosis of cancer in mammals. TAT polypeptides, nucleic acids.

```
The invention relates to an isolated polypeptide (I) comprising 7-30 consecutive amino acid residues of human mammaglobin, where one or more mammaglobin-specific 7 cells specifically reacts with (I). Also included are (I) a composition comprising (I), in combination with a physiologically acceptable carrier or immunostimulant; (2) a diagnostic kit, comprising (I), in comprising a reporter group; (3) removing tumour cells from a biological sample, by contacting a biological sample with T cells that specifically react with (I), under conditions and for a time sufficient to permit the removal of cells expressing mammaglobin or a peptide epitope from the sample; (4) an isolated T cell population (II), comprising T cells prepared using (I); and (5) a composition (C2) comprising a polynucleotide comprising a sequence encoding human mammaglobin (or variant or tagged with an affinity tag), in combination with an affinity tag), in combination with an affinity tag), in combination with an affinity tag), in combination with an affinity tag), in combination with an affinity tag), in combination with an affinity tag), in combination with an affinity tag), in combination with an affinity tag). In combination with an affinity tag), in combination with an affinity tag), in combination with an affinity tag), in combination with an affinity tag). In combination with an affinity tag, in combination with an armanglabon correct optionally cloning at least one proliferated T cells to the patient optionally cloning at least one proliferated T cells to the patient. The compositions and methods are useful for inhibiting the development of breast cancer in the patient. The compositions and methods are useful for contaction or with an ammaglobin variant protein or fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 MKLLMVLMLAALSQHCYAGSGCPLLENVISKTINPQVSKTEYKELLQEFIDDNATTNAID 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated polypeptide (I) comprising 7-30 consecutive amino acid residues of human mammaglobin, where one or more nammaglobin-specific T cells specifically reacts with (I). Also included are (I) a composition comprising (I), in combination with a physiologically acceptable carrier or immunostimulant; (2) a diagnostic kit, comprising (I), in compination with a physiological sample with T cells from a biological sample, by contacting a biological sample with T cells from a biological sample, by contacting a biological sample with T cells from a biological sample, by contacting a biological sample with (I), under conditions and for a time sufficient to permit the removal of cells expressing mammaglobin or a peptide epitope from the sample; (4) and solated T cell population (II), comprising T cells prepared using (I); and (5) a composition (C2) comprising a polymuclectide comprising a caquence encoding human mammaglobin (or variant or tagged with an affinity tag), in combination with an affinity tag), in combination with an affinity tag), in combination with an affinity tag, in combination with an affinity tag, in combination with a cells is colated from a patient with a mammoglobin epitope, such that T cells is proliferated. Administering the proliferated T cells to the patient, optionally cloning at least one proliferated T cells and administering at cancer in the patient. The compositions and methods are useful for inhibiting the development of breast with the davelopment of present the patient. The compositions and methods are useful for which the davelopment of the patient of the patient with a material and administering at the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the pa

The invention relates to an isolated polypeptide (1) compitating (-3) of the consecutive amino acid residues of human mammaglobin, where one or more mammaglobin-specific T cells specifically reacts with (1). Also included are (1) a composition comprising (1), in combination with a physiologically acceptable carrier or immunostimulant; (2) a diagnostic kit, comprising (1) and a detection reagent comprising a reporter group; (3) removing tumour cells from a biological sample, by contacting a conditions and for a time sufficient to permit the removal of cells carriers ammaglobin or a peptide epitope from the sample, (4) and isolated T cell population (11), comprising T cells prepared using (1); and (5) a composition (2) comprising a polynucleotide comprising a sequence encoding human mammaglobin (or variant or tagged with an affinity tag), in combination with an affinity tag), or a polypeptide comprising a human mammaglobin (or variant or tagged with an affinity tag), in combination with an immunostimulant. The peptide is useful for inhibiting the development of breast cancer in a patient with a mammaglobin epitope, such that T cells proliferate, administering the proliferated T cells to the patient, optionally cloning at least one proliferated T cells to the patient, optionally cloning at least one proliferated T cells and the administering at least one cloned cell, and thus inhibiting the development of breast cancer in the patient. The compositions and methods are useful for inhibiting the development of breast cancer in a patient. The presset cancer in a patient. The presset cancer in a patient. The presset cancer in the patient of breast cancer in a patient. The presset cancer in a patient. The presset cancer in a patient. The presset cancer in a patient. The presset cancer in a patient. The presset cancer in a patient. The presset cancer in a patient. The presset cancer in a patient of breast cancer in a patient. The presset cancer in a patient of breast cancer in a patient.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BS106 is a breast tissue gene with which breast cancer and related diseases are associated. The BS106 polypeptides AAW42088-W42092 can be utilized in a variety of of assays for the detection of antibodies to breast tissue. They can also be used as immunogens for the detection of antibodies to breast tissue. The products and methods discussed in this invention can be used for detecting, diagnosing, staging, preventing or treating, or determining predisposition to diseases or conditions of the breast cancer. This sequence represents a human secreted protein of the invention. The extended CDMAs (or genomic DNAs obtainable from them) may be used to prepare PCR primers and probes. These are useful for forensic matching or positive identification by DNA sequencing. They may also be used in alternative fingerprint identification techniques. Antibodies against the proteins encoded by the extended CDNAs are useful in identification of tissue types or cell species, as well as identifying tissue specific soluble proteins. The sequences can be used for chromosome mapping and cleantification of genes associated with hereditary diseases or drug response. signal sequences from the CDNAs can be used in construction of secretion vectors. Other sequences derived from the extended CDNAs can be used to clone upstream genomic DNA sequences including promoters. This is in turn useful for identifying proteins that interact with promoter sequences. Some of the proteins may be useful in diagnosing and treating everal disorders including, but not limited to: cancer, hyperlipidaemia, cardiovascular and neurodegenerative disorders, autoimmune diseases, and theumatic diseases, embryogenic disorders, hypertenison, renal injury, amino acidurias, hypoglycaemia, male rat infertility and myopathies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAX00602) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 87 novel genes and their fragments (nucleic acid sequences AAM67807-4; amino acid sequences AAM67807-4) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also,

pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polymucleotides. Specific uses are described for each of the 87 polymucleotides, based on which tissues they are most highly expressed in (see AAX00611 for described uses)
                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides BS106 polynucleotides (AAX55578-82) and polypeptides (AAY13466-470). The BS106 nucleic acids correspond to a breast tissue gene and can be used as markers for breast tissue disease. The products can be used for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining diseases or conditions associated with BS106, especially breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 MKFLAVLVLLGVSIFLVSAQNPTTAAPADTYPATGPADDEAPDAETTAAATTATTAAPTT

                                                                                                                                                                                                                                                                                              The invention provides membrane-bound PRO polypeptides and polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain bomology screening. The PRO sequences have homology with proteins including LDL receptors. TIE ligands and various enzymes. The membrane-bound proteins and receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor-ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is encoded by a cDNA sequence which was isolated from a breast tumour cDNA library. It is provided in a specification relating to compounds for immunotherapy and diagnosis of breast cancer. Breast tumour antigens and the polynucleotides that encode them may be used in the production of a pharmaceutical composition to be used in the treatment of breast cancer. Proliferated T cells and incubated antigen presenting cells are also required. The polypeptides and polynucleotides may also be used to produce a vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MKFLAVLVLIGVSIFLVSAQNPTTAAPADTYPATGPADDEAPDAETTAAATTATTAAPTT 60

The invention relates to human BS106-specific polypeptides and polymoclectides. The BS106 polypeptides and antibodies are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing, treating or determining the predisposition of an individual to diseases and conditions of the breast such as breast cancer. They are also useful in the treatment of tumours or metastases. Polymucleotides of the invention are useful in drug screening and gene therapy. The present sequence is human BS106 antigenic epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               BCH1 genes and protein useful for the diagnosis and treatment of breast
                                                                                                                              A gene or its fragment which codes for a BS106 polypeptide, useful for the detection of a breast disease such as breast cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                               New methods for screening drug candidates are described which comprise adding a drug candidate to a cell that expresses a protein selected from BCHI, BCAZ, BCMI, BCMI, BCMS, BCC2, BCC2, BCM2 and BCM3 or their fragments and determining the effect of the drug on the expression of those proteins. Antibodies to breast cancer genes (specifically BCH1 or its fragment (BCH1p1 or BCH1p2)) are useful for inhibiting and treating breast cancer in individuals who are non-responsive to anti-oestrogen and positive for oestrogen receptor. Compositions comprising BCH1 or a nucleic acid encoding BCH1 are useful for eliciting an immune response in an individual. The antibodies are also useful for the diagnosis and prognosis of breast cancer and for screening compositions which modulate the breast cancer phenotype. The method allows rapid and simple detection of lymph node metastases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                        Screening drug candidates for their ability to modulate breast cancer by contacting the drug to a cell expressing an expression profile gene and determining modulation of expression of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; BS106 protein; breast cancer; metastasis; gene therapy; tumour;

that involves performing a genetic subtraction to identify pool of (P) from tissue of interest (TI), performing DNA microarray analysis to identify first subset of polynucleotides (SPI) at least 2-fold over expressed in TI, and performing quantitative polymerase chain reaction (PCR) analysis on SPI to identify second subset of (P). The method is useful for determining the presence or absence of a cancer cell in a patient, monitoring the progression of cancer in a patient using a biological sample such as blood, serum, lymph nodes, bone marrow, sputum, urine or a tumour biopsy sample. The methods are useful for determining the presence or absence of or monitoring progression of prostate, breast, colon, ovarian, lung, head and neck, lymphoma, leukemia, melanoma, liver, gastric, kidney, bladder, pancreatic or endometrial cancer. The present sequence represents B511S polypeptide

                                          The present sequence represents a human breast cancer protein, designated BCH1. BCH1 is upregulated in breast cancer tissue, and is found on chromosome 12, cytoband 12q12. BCH1 can be used as an indicator of breast cancer, for determining non-responsiveness to anti-oestrogen therapy and for treating breast cancer. BCH1 is useful for determining the prognosis of breast cancer and for determining whether an individual with breast cancer will be responsive to anti-oestrogen therapy (where the patient is positive to responsive receptor), where high levels indicate poor prognosis and non-responsiveness, respectively. BCH1 is also useful for screening for candidate drugs and bloactive agents. Inhibitors, antibodies and antibodies to BCH1 are useful for treating breast cancer. Cantibodies to BCH1 are useful for localizing a therapeutic moiety (e.g. cyctoxic agent cancer tissue, and for treating breast cancer.
